TIGRE

Irrigation Line

Technical Catalog and Products

Grupo TIGRE
A better world is at work.

A BETTER TOMORROW FOR EVERYONE. THAT IS HOW WE LEAVE A MARK ON THE WORLD.

Each of our actions or products have a unique purpose: build a better world for everyone.

A better world for our workers who, united and guided by solid values, create innovative solutions to turn people's dreams into reality.

A better world for our customers, who rely on and trust the technology of a world-leading brand.

A better world for the planet, with every drop of its most precious natural resource respected and preserved with care.

We are today a multinational company admired worldwide, with 24 manufacturing sites (10 in Brazil and 14 abroad), operating in over 40 countries. That is the result of the work of over 5,000 dedicated employees.

We are proud of those figures; but what really inspires us, is to know that a better world is at work.

For Tigre, it will become even better for everyone.

Our solutions

Whether you are building or renovating, count on Tigre! We have over 75 years of history and innovation with complete product lines for each stage of your project. As important as having a pioneer and transforming posture is to provide millions of Brazilian homes with solutions that guarantee ease and comfort. Either for home renovation, industrial building works, real property and artistic paining, plumbing fixtures, drainage projects, sanitation, agriculture and livestock, mining, or other applications, Tigre ensures innovative solutions for any stage. And the best part: they are easy to install and very secure.

Table of Contents

Irrigation

Agriculture depends on advanced drainage and irrigation models, with differentiated technological innovations, to operate the systems effectively and rationally. Tigre provides fixed and portable sprinkler systems for water and energy savings, increasing productivity in agribusiness and preserving the environment.

TigreMax Agro

FIXED SYSTEMS

1. TigreMax Agro

TIGRE developed the TigreMax Agro Line as a solution for the conditions of fixed high-pressure water mains in permanent irrigation systems..

1.1. Function/Application

These pipes are designed for conducting and distributing pressurized water in buried piping networks of irrigation and fertigation systems.

1.2. Benefits and Differentials

Productivity
The lower weight and practicality of the JEI joint provides greater speed and agility in the installation and maintenance of networks, in addition to avoiding inventory and lack of rings on site.

Pressure Resistance
Higher pressure classes than traditional PVC pipes.

Mechanical resistance
High impact, fatigue and cracking resistance: Due to the orientation of the molecules and the lamellar structure of PVC-O, it presents high resistance to impact, fatigue, and cracking.

Chemical Resistance
Non-toxic and highly resistant to corrosion and abrasion.

Interchangeability
With cast iron pipes and "Irriga LF DEFoFo" pipes in all their extension.

Guaranteed tightness
The elastic joint system integrated into the pipe pocket eliminates the possibility of its displacement during the execution of the joint.

1.3. Technical Characteristics

1.3.1 Pipes

Material: Pipes made from oriented unplasticized polyvinyl chloride (PVC-O) compound.

Color: White with blue stripes.

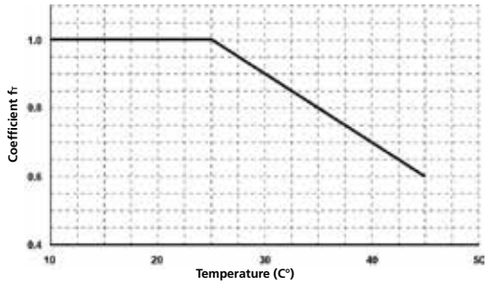
Joints: Integrated Elastic Joint (IEJ).

PIPE GAUGES: The TigreMax Agro line is available in DN 100, DN 150, DN 200, DN 250, DN 300 and DN 350 diameters.

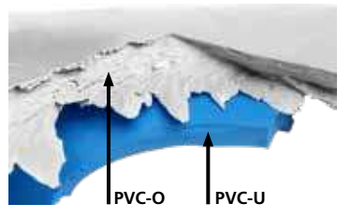
Length of spigot/socket pipe: 6.0 m.

MRS 50: Tigre is the only manufacturer of PVC-O that achieves the minimum required strength of 50 MPa in the TigreMAX product line, resulting in pipes with higher mechanical resistance than required.

Pressure class at 25°C/77°F temperature: PN 14.5 (14.5 Kgf/cm²) and PN 18 (18 Kgf/cm²). Additional correction factor "fₜ" for calculating the nominal pressure in case of use with temperatures between 25°C/77°F and 45°C/113°F.



Manufacturing: Process of extruding PVC pipes that, after extrusion, undergoes an orientation process with Molecor® technology, which orients the molecular chains of PVC in the direction of the main stresses (circumferential and longitudinal), forming a lamellar structure.



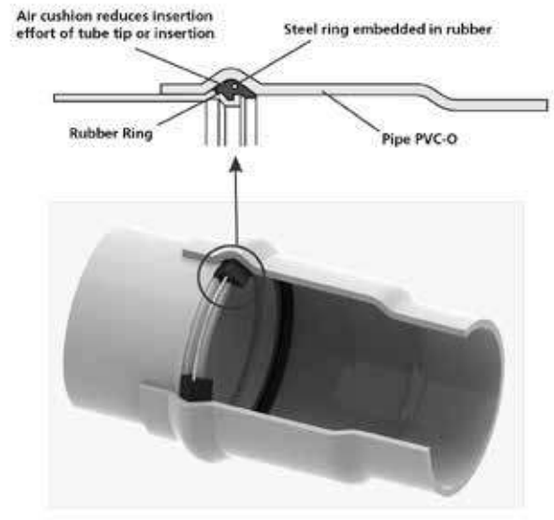
© MolecorTecnología S. L.

1.3.2 Sealing System

Material: Lip ring with metallic core embedded in the rubber.

Color: Black.

Manufacturing: Made of EPDM (ethylene-propylene-diene monomer).



Below is a list of reference standards that govern the manufacture of the TigreMax Agro line. These standards ensure excellent performance and provide a high degree of safety to the installations.

REFERENCE TECHNICAL STANDARDS	
NBR 15750	PVC-O pipes (oriented unplasticized polyvinyl chloride) for pressurized water or sewage transport systems - Requirements and test methods.
NBR 17015	Execution of linear works for the transport of raw and treated water, sewage, and urban drainage, using rigid, semi-rigid, and flexible pipes.
NBR 7676	Elastomeric thermoset sealing elements for pipes, fittings, equipment, components, and accessories for water, sewage, drainage, stormwater, and hot water – Requirements.
ISO 16422	Unplasticized poly(vinyl chloride) (PVC-O) pipes and fittings for the conveyance of water under pressure - Specifications.

1.4. Handling

1.4.1. Transport

Avoid exposing the material to strong impacts and friction with stones, metal objects, and sharp edges in general.

The support surface must be flat since the pipes must not undergo bending efforts for a long time.

In loading and unloading operations, shocks, knocks and friction must be avoided, especially on the tips and pockets. Pipes must always be carried, not dragged.

1.4.2. Storage

It must be in an easily accessible and shady place, free from direct action or continuous exposure to sunlight (sheltered place).

It is very important that the support structure is level and that the pipes have at least one support every 1.5 linear meters.

It is recommended to stack them in a firewood or longitudinally aligned shape, in piles that do not exceed 1.5 m in height.

"Irriga LF" pipes should be stored with male and female ends alternated, without the sockets touching each other.

For temporary protection of the pipes, we recommend making a wooden structure that is easy to disassemble and, on top of this, a covering with tiles, in such a way that the pipes are 30 to 50 cm away from the roof, so that the heat does not damage them.

1.5. TigreMax Agro Line Items

• PVC-O Pipe TigreMax Agro PN 14,5

HDPE

FIXED SYSTEMS

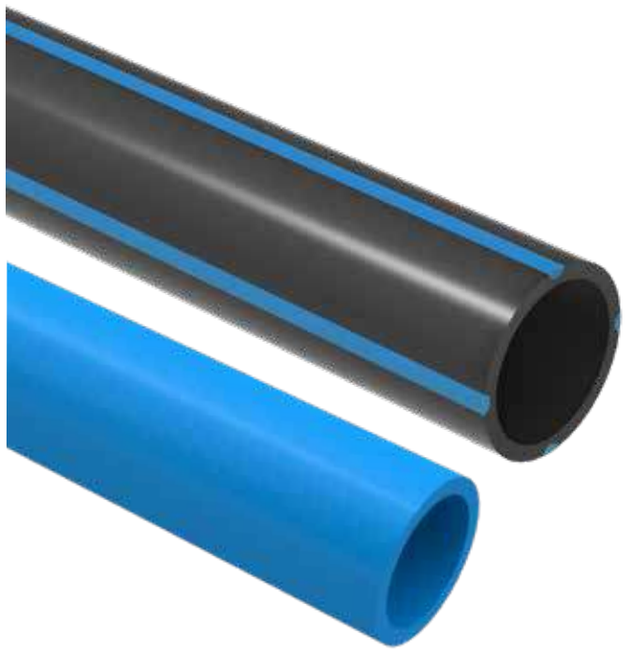
2. HDPE

TIGRE has a polyethylene pipe system that ensures greater flexibility in water and sewage network projects. Polyethylene is a thermoplastic material intended for various applications due to its characteristics of low roughness, corrosion resistance, high flexibility, among others.

Its service life is at least 50 years, a time proven through tests carried out by the raw material supplier and by Tigre S/A itself, always using high-quality virgin raw material.

2.1. Function/Application

Transport of water and sanitary sewage in pressurized networks.



2.2. Benefits and Differentials

Resistant
It has resistance to stress-cracking and impact resistance, in addition to high chemical and abrasion resistance.

Flexible
Lightweight and flexibility, allowing for long radius bends in the trench (20xED).

Tightness
Excellent weldability.

Corrosion resistance
HDPE pipes are immune to corrosion and are not affected by galvanic corrosion or aggressive soil action.

Better hydraulic performance
Excellent hydraulic characteristics due to the smooth inner surface.

Durable
High service life. Tigre guaranteed quality.

Non-toxic
The material does not impart any taste or odor to the water.

Lightweight
Ease of transport and handling due to the lightness of the bars.

2.3. Technical Characteristics

Color: Blue and Black with Blue stripes.

Supply: Coils and Bars.

Pressure classes: PN 8 to PN 25Kgf/cm2.

Resistance to U.V rays.

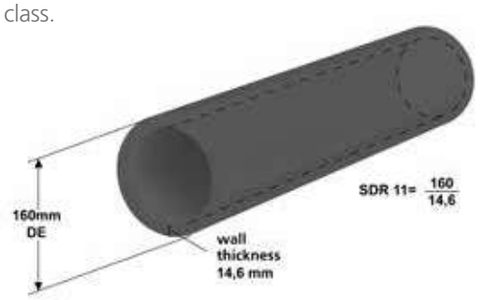
Below is a list of reference standards that govern the manufacture of HDPE. These standards ensure excellent performance and provide a high degree of safety to the installations.

REFERENCE TECHNICAL STANDARDS	
NBR 15561	Polyethylene piping PE 80 and PE 100 for transporting water and sewage under pressure.
NBR 15802	Buried systems for water distribution and sewerage transport under pressure - Requirements for projects using PE 80 and PE 100 polyethylene pipes with nominal external diameter between 63 mm and 1600 mm.
NBR 14464	Plastic pipes and fittings - Butt fusion jointing of polyethylene (PE) pipes and fittings
NBR 14465	Plastic pipes and fittings - Union by electrofusion welding in PE 80 and PE 100 polyethylene pipes and fittings.

2.4. Instructions

2.4.1. Assembly / Installation

SDR (Standard Dimensional Ratio)
It is a dimensionless value that relates to the outside diameter and minimum wall thickness of the pipe. Each SDR associated with the compound in which the pipe (PE 80 and PE 100) was manufactured represents a pipe pressure class.



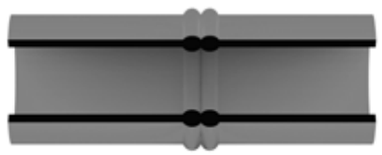
2.4.2. Weldable Joints

- Polyethylene, despite not accepting any type of plastic adhesive, is easily fusible under the effect of temperature.
- Weldable joints can be made by electrofusion or thermo-fusion process (butt weld). These processes fuse the materials in contact, forming a unique set.

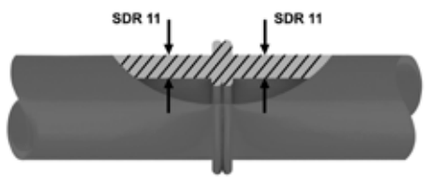
Note: We do not recommend socket welding.

2.4.3. Butt Fusion Welding

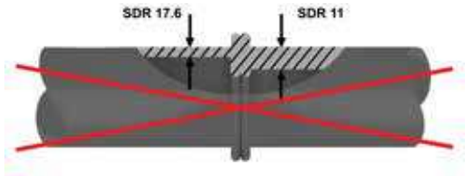
A welding process that makes use of specific equipment, in which two ends of pipe/fittings are simultaneously heated and pressed against each other. The result is the fusion of the two ends. One way to verify the quality of the weld is by observing the weld bead that forms on the bottom and exterior of the pipe.



Products with the same SDR and the same compound or with the same SDR and different compounds (PE 80, PE 100) can have their joint made by butt fusion welding. In the case of butt fusion welding with the same SDR and different PE, verify the pressure conditions of the network.



Products of different SDR cannot have their joint performed by thermofusion (butt weld).

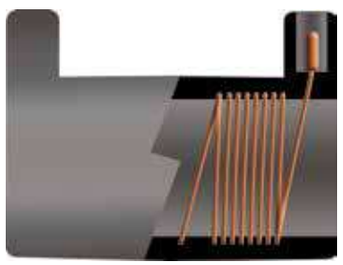


It is recommended to protect the area to be welded against the weather.

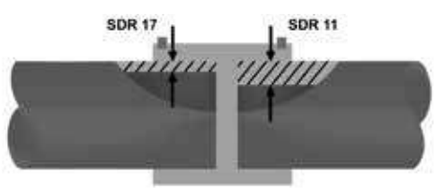
2.4.4. Electrofusion

Welding process in which a controlled intensity electric current passes through a resistance present in the fitting, heating it and transferring sufficient energy to the pipe to fuse the two elements.

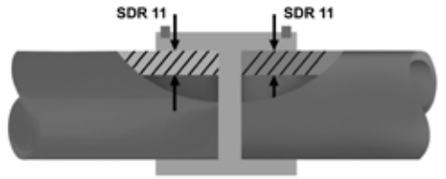
The execution of electrofusion welding is performed using a device (electrofusion machine) that controls the voltage supplied to the fitting (39.5V) and the time required to reach the fusion temperature and cooling of the elements.



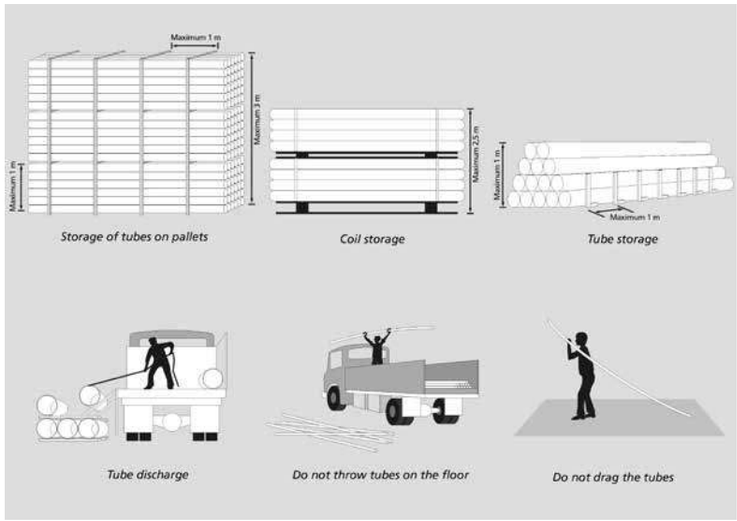
Products of different SDR can be electrofusion welded.



Products of the same SDR and different compounds can be electrofusion welded.



2.4.5. Handling



- Store the materials in the packages, in covered areas, protecting them from the weather, preferably in flat places, free of stones or sharp materials that could damage the surface of the pipes.
- Store materials with maximum heights and maximum support spacing allowed.

2.4.6. Storage

- Storage of coils: maximum height: 1.5 m or two layers (whichever is smaller).
- Pipe storage: maximum height: 1.8 m or 12 layers (whichever is less).
- Storage of pipes on pallets: maximum height: 3 m, segmented in layers of 1 m.

Irriga LF

PERMANENT SYSTEMS

3. Irriga LF

TIGRE developed the Irriga LF Line to offer rational solutions to different permanent lines in permanent irrigation systems.

Destined to buried or partially exposed permanent lines, the Irriga LF Line is for localized irrigation and sprinkler irrigation systems.

3.1. Function/Application

PVC pipes and fittings with butt weld or bell and spigot joints for buried or partially exposed permanent lines, for localized irrigation systems (drip or micro-sprinkler systems) and semi-permanent sprinkler systems. Used in main lines and branch lines.

3.2. Benefits and Differential Factors

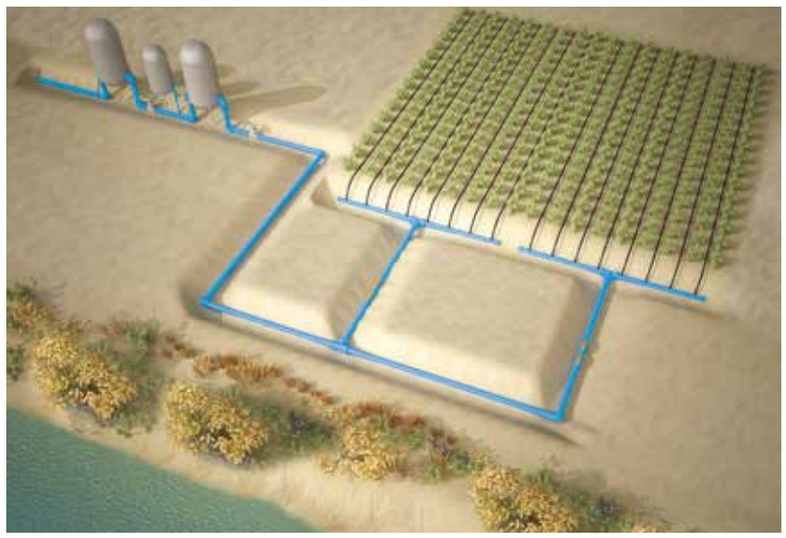
Ease of installation
With butt weld joint or bell and spigot joint.

Complete line
Meets different installation needs.

Lightweight
Ease of transport, storage, and handling.

Resistance
Resists to chemicals used in fertirrigation and contaminated soils.

Easy maintenance
The installation can be performed in different locations and configurations, whether point to point or in kits.



3.3. Technical Characteristics

Material: Pipes and fittings manufactured in PVC, Poly(vinyl chloride).

Color: Blue.

Joints: Butt weld (adhesive) and gasket (rubber seal ring)

Gages: The Irriga LF line is available in 35, 50, 75, 100,150, and 200 mm diameters.

Pipe length: 6.0 m.

Pressure class: PN 40 (40 m.c.a.), PN 60 (60 m.c.a.), PN 80 (80 m.c.a.) and PN 125 (125 m.c.a.).

Stiffness Class:

- PN 40 = 1800 Pa
- PN 60 = 4800 Pa
- PN 80 = 8500 Pa
- PN 125 = 15000 Pa

Nota:
Pa – Pascal – The International System of Units' standard pressure unit.

Below is the list of reference standards concerning the manufacturing of the Irriga LF line that ensure excellent performance, providing the installations with high safety.

REFERENCE STANDARDS	
ABNT NBR 14312	Irrigation and drainage - PVC pipes with solvent gluing or elastic joint PN 40 and PN 80 for permanent irrigation systems.

3.4. Instructions

3.4.1 Butt weld joints

1. Chamfer the bell end of pipe. Sand the bell end and spigot end of pipe with a 100 grit sandpaper and mark the depth of the spigot

2. Prepare the surfaces to be welded using the TIGRE Priming Fluid.

3. Apply the TIGRE Plastic Adhesive in the bell end and spigot.

4 Align and attach the bell end tothe spigot end, removing any excess plastic adhesive.

3.4.2 Elastic Joints

1 Chamfer the bell end of pipe. Measure the depth of the spigot end and mark it to the bell end.

2 After cleaning the bell end and spigot end of the pipe, house the gasket in the ferrule.

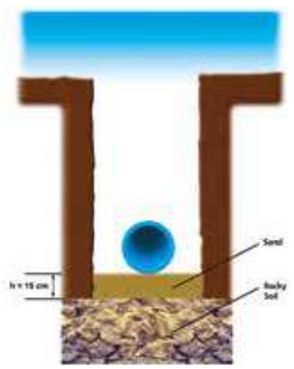
3 Apply the TIGRE Lubricant Paste to the gasket and the bell end of the pipe.

4 Align the pipes and attach the bell end to the spigot end. Pull 1 cm back, using the marking on the pipe as a reference.

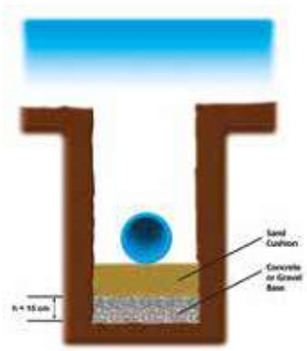
3.5. Installation in the Ditch

3.5.1 Digging, Excavation, Preparation, and Leveling of Ditch Bottom

1) Ditch excavation should be such that the debris is far from the edge of the ditch, thereby avoiding landslides when handling the piping.



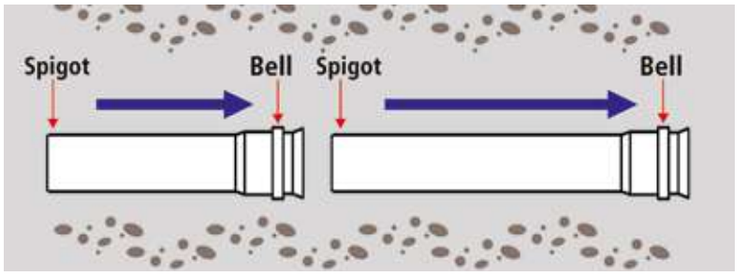
2) For rocky soils (decomposed rock, loose rock, and bedrock), a sand cushion (free of rocks, avoiding bumps) of a minimum height of 15 cm over the pipes, is necessary.



3) When the ditch bottom is composed of saturated clay, peat, or mud, without minimum mechanical conditions for laying the pipes, a gravel or concrete base, properly piled, is necessary. Laying of pipes over said bases must be on a sand cushion or an equivalent material.

3.5.2 Piping Laying, Jointing

1) The mounting direction must preferably be from the bell end to the spigot end of the pipes.

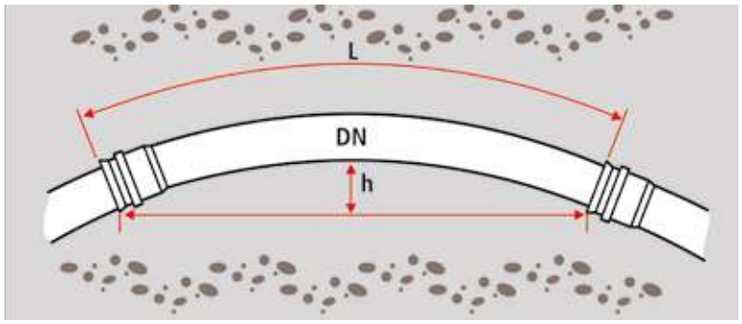


2) Heating the pipes for formation of curves, spigots, or holes, is not permitted.

3) Lay the pipes with a slight sinuosity over the axis of the ditch.

4) For elastic joints, always use lubricant paste, since oil or grease can damage the rubber seal ring.

5) In piping with smaller diameters, a little deflection in the pipes (see Table 1) is possible, provided that the region of the splice is aligned by propping with wooden paddocks.



Important:
When deflecting the pipes, provide the anchoring of the piping such that the spigots are free from bending stress.

Note: When the conditions are such that the pipes are subject to bending (especially those with larger diameters), use slip couplings.

Table 1 - Pipe Deflection

DIAMETER (DN)	H (M)
50	0.075
75	0.065
100	0.055
125	0.045
150	0.040

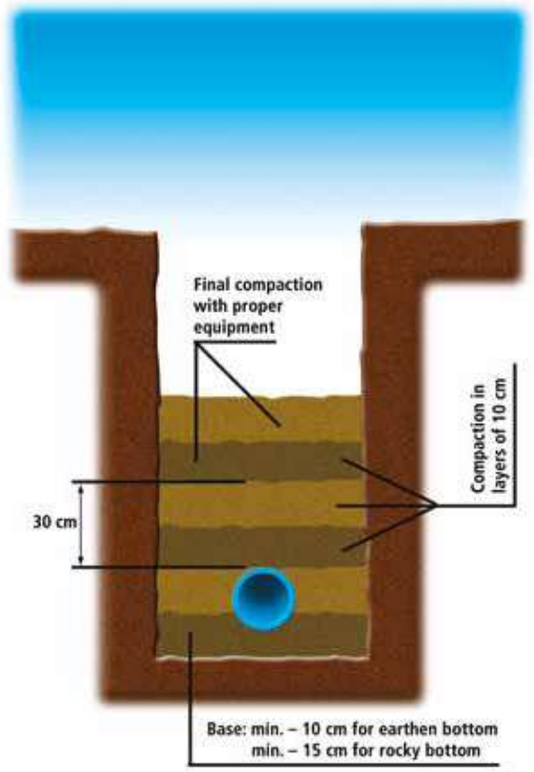
3.5.3 Pavement Backfill and Restoration

1) Before performing the backfill, all the joints must be checked for their watertightness. Inspections must be made, preferably between branch pipes and at most, every 500 meters.

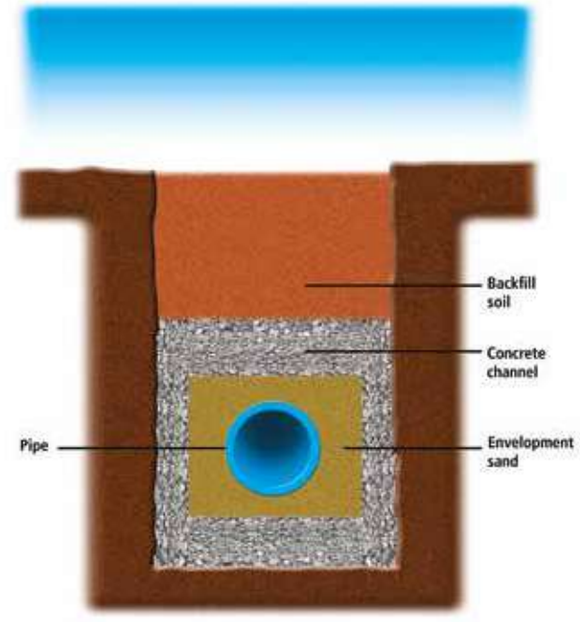
2) The piping with be covered with selected materials (free of rocks) at least up to 30 cm above the top generating line. Compaction must be in successive layers of 10 cm, and, until achieving the height of the pipe, compaction must be made manually only on the sides of the pipe.

3) The rest of the material should be poured in successive layers of 30 cm, and compacted so that they achieve the same ground condition as the sides of the ditch.

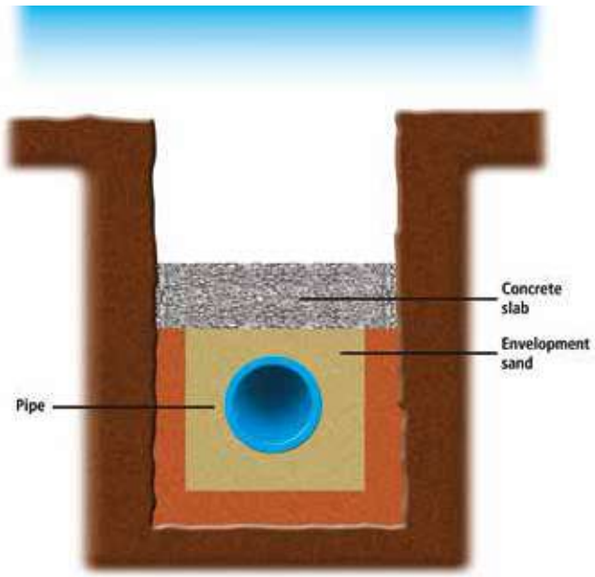
4) Observe the indications of the project and never use wheeled machines when compacting the ditch.



5) When the depth of the ditch is below 80 cm or when the pipeline goes through areas with heavy traffic loads, special measures for protecting the pipeline are necessary, such as making channels with the pipes inside, enveloped in granular material and a proper reinforced concrete cover (situation A), or a proper reinforced concrete slab (situation B).



SITUATION A



SITUATION B

6) Direct enveloping of PVC pipes with concrete is not recommended as the concrete may break and reach the pipes. However, when the designer chooses this solution, he must dimension the concrete envelope, providing it with reinforcement to guarantee its performance as a continuous beam.

3.6. Recommendations

3.6.1 Connection to equipment or other materials

Threaded adapters, available for this TIGRE product line, allow easy interconnection to equipment or other materials.

3.6.2 Types of Joints

Irriga LF pipes and fittings and interconnected using two types of joints.

Elastic Joints

If the line is not buried, special devices (couplings) that prevent the pipes from decoupling are not necessary. Laying of bell and spigot pipes with an elastic joint (rubber seal ring) is preferable.

Note:
For buried lines, an elastic joint (JE) is preferable, as its sealing is obtained with a rubber seal ring.

Butt weld joints

For assembling small exposed sections of permanent lines, usually sections of interconnections to equipment and other materials and surface branch pipes, a butt weld joint (with adhesive) is necessary.

Butt weld joints welded with adhesive is not recommended for lengths above 20 meters, due to longitudinal stresses that may occur as a consequence of thermal effects (expansion and contraction of materials subject to temperature variations).

Table 2 - Consumption of Lubricant Paste

Gages	Lubricant Paste	Adhesive	Cleaning Solution
DN	(g / joint)	(g / joint)	(cm3 / joint)
35	NA	4,5	6,2
50	10	6.2	11.0
75	15	14.2	26.0
100	25	20.8	40.0
125	30	25.4	46.0
150	35	26.0	50.0

3.6.3 Head Loss Tables

Below are the head loss tables for the Irriga LF pipes, which are useful for dimensioning the lines when preparing the projects.

The calculation of head loss was based on the Colebrook Equation, the Universal Head Loss Equation, the Reynolds Number, and the Continuity Equation. Our results are deemed the most accurate according to the current concepts and technical resources of computer processing.

Colebrook Equation

$$\frac{1}{\sqrt{f}} = -2 \log_{10} \left(0{,}27 \frac{K}{D} + \frac{2{,}51}{R \sqrt{f}}\right)$$

Continuity Equation

$$Q = \frac{\pi D^2}{4} \qquad V = Cte.$$

Reynolds Equation

$$R = \frac{VD}{v}$$

Universal Head Loss Equation

$$hf = f. \frac{L}{D} \frac{V^2}{2g}$$

3.8. Handling

3.8.1. Maintenance

Maintenance operations with Irriga LF PVC pipes, can be carried out by using rigid PVC slip couplings.

The damaged section must be replaced with a segment of the same type of pipe. Use two slip couplings, one at each end.

3.8.2. Transport

Avoid strong impacts and friction with stones, metal objects, and sharp edges.

The supporting surface must be flat, as the pipes must not sustain bending stresses for a long time.

In loading and unloading operations, avoid shock, bumps, and friction, especially in the bell and spigot ends of the pipes. Always carry, and do not drag, the pipes.

3.8.3. Storage

Store at an easily accessible, shaded location, away from direct or continuous sunlight (covered area).

The supporting structure must be leveled and the pipes must have a brace every 1.5 meter.

Stack the pipes in the shape of a bonfire or aligned lengthwise, in stacks not exceeding 1.5 m high.

Irriga LF pipes must be stored with their male and female ends alternated such that the spigots do not touch each other.

For temporary protection, we recommend a wooden structure that is easy to disassemble, and covering it with tiles so that the pipes are 30 to 50 cm away from the roof so that the heat does not damage them.

Notes

Irriga LF DEFoFo

PERMANENT SYSTEMS

4. Irriga LF DEFoFo Line

Irriga LF DEFoFo Line pipes are used in permanent lines of irrigation systems, since they are an essential component in the system in every all methods.

In those cases, we observed that TIGRE PVC pipes were rarely used in the system, because they are in buried permanent lines.

4.1. Function/Application

Water conveyance for irrigation systems at room temperature, used in water pipelines in irrigation and fertirrigation systems.

4.2. Benefits and Differential Factors

Quick installation
More productivity while reducing the costs (joints already built in the pipe).

Integrated Elastic Joint
Avoids ring displacement during assembly.

Reduced insertion force

Durability
Increased useful life.

Chemical Resistance
Can be used in aggressive soils and fertirrigation.

Increased productivity
Faster laying (m/day).

Easiness
Simplified inventory control (in a single product).

Interchangeable
With cast iron systems.

4.3. Technical Characteristics

Material: Pipes and fittings manufactured in PVC, Poly(vinyl chloride).

Color: Blue.

Gage Diameter: DN100, DN150, DN200, DN250, DN300, DN350, DN400, and DN500.

Pipe length: 6.0 m.

Sealing: SBR (styrene-butadiene) rubber.

Elastic Joint: JEI (Integrated Elastic Joint), rubber ring not removable by hand.

Working pressure:

- PN 60 (6,0 kgf/cm² or 60 m.c.a.)
- PN 80 (8,0 kgf/cm² or 80 m.c.a.)
- PN 125 (12,5 kgf/cm² or 125 m.c.a.)

Stiffness Class:

- PN 60 = 2700 Pa
- PN 80 = 4000 Pa
- PN 125 = 16000 Pa

Note: Pa – Pascal – The International System of Units' standard pressure unit.

List of reference standards concerning the manufacturing of the Irriga LF DEFoFo line that ensure excellent performance, providing the installations with high safety.

REFERENCE STANDARDS	
ABNT NBR 7665/2007	Systems for water pipelines and water distribution. – PVC12 DEFoFo pipes with elastic joint.
ABNT NBR 14311	Irrigation and drainage - PVC Pipes DEFOFO PN60, 80 and 125 with elastic joint to permanent irrigation systems.
ABNT NBR 9822	Laying of rigid PVC pipes for water pipelines and water systems.

4.4. Integrated Elastic Joint

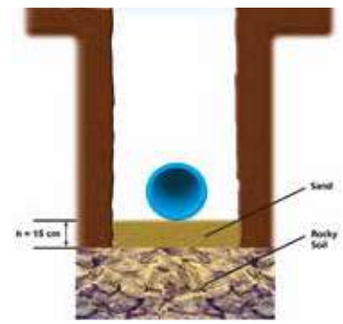
This is the element that incorporates the sealing ring during the manufacturing process. While the conventional technology required manual placement of the rings while laying the pipes, the JEI technology eliminates that task. That ensures more reliability and safety of the joint and increases productivity and savings during the installation. The JEI technology was developed in Norway and became a solution accepted worldwide.

4.5. Instructions

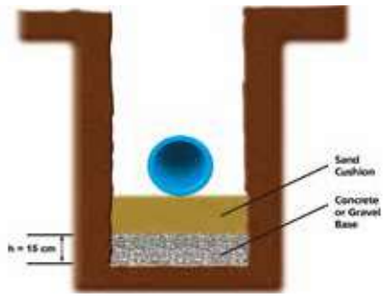
4.5.1. Digging, Excavation, Preparation, and Leveling of Ditch Bottom

1) Ditch excavation should be such that any debris from pavement digging or any base from soil cladding is far from the edge of the ditch, thereby avoiding improper use in the envelopment.

2) For rocky soils (decomposed rock, loose rock, and bedrock), a sand cushion (free of rocks) of a minimum height of 15 cm over the pipes, is necessary. The ditch bottom must be uniform, with no bumps. For such use sand or equivalent materials.



3) When the ditch bottom is composed of saturated clay, peat, or mud, without minimum mechanical conditions for laying the pipes, a gravel or concrete base, properly piled, is necessary. Laying of pipes over said bases must be on a sand cushion or an equivalent material.



4.5.2. Laying Length

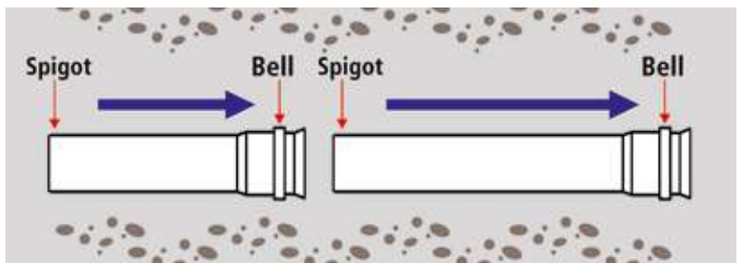
Table 3 presents the laying length for the pipes, which must be taken into account when preparing projects and determining the quantity of materials, per ABNT.

Table 3 - Minimum Laying Length

DN	DE	Minimum laying length (m)
100	118	5,83
150	170	5,83
200	222	5,75
250	274	5,75
300	326	5,75
400	429	5,68
500	532	5,68

4.5.3. Piping Laying and Jointing

1) The mounting direction must preferably be from the bell end to the spigot end of the pipes.



2) Heating the pipes for formation of curves, spigots, or holes, is not permitted.

3) Lay the pipes with a slight sinuosity over the axis of the ditch.

4) In piping with smaller diameters, a little deflection in the pipes (see Table 4) is possible, provided that the region of the splice is aligned by propping with wooden paddocks.

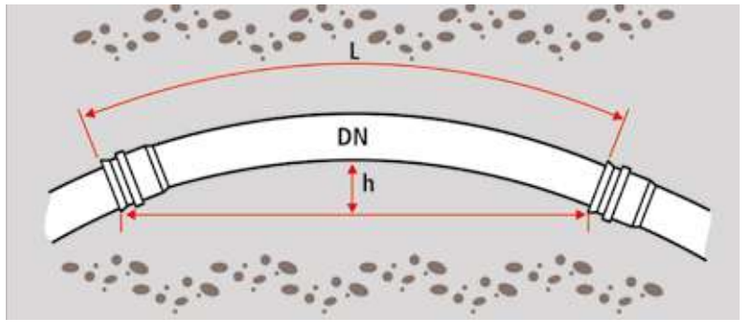


Table 4 - Allowed Pipe Bending*

DN	DE (mm)	h (m)
100	118	0,1
150	170	0,035
200	222	0,020
250	274	0,015
300	326	0,015
400	429	0,01
500	532	0,01

* Anchoring of spigots is necessary.

5) Always use Lubricant Paste in the elastic joint, since oil or grease can damage the rubber seal ring.

6) After inserting the chamfered end into the bottom of the spigot end, set it back approximately 1 cm, to create a span that allows any piping movement from expansion and settlement of the soil. To facilitate the process, mark the depth of the spigot end in the end of the pipe.

7) Elastic joint fittings must be anchored with anchor blocks designed such that they can resist to any longitudinal and transversal stresses since the elastic joint does not absorb such stresses.

8) Equipment must be anchored in the direction of the weight and any possible longitudinal stress, so that these parts can work free of any stress or strain.

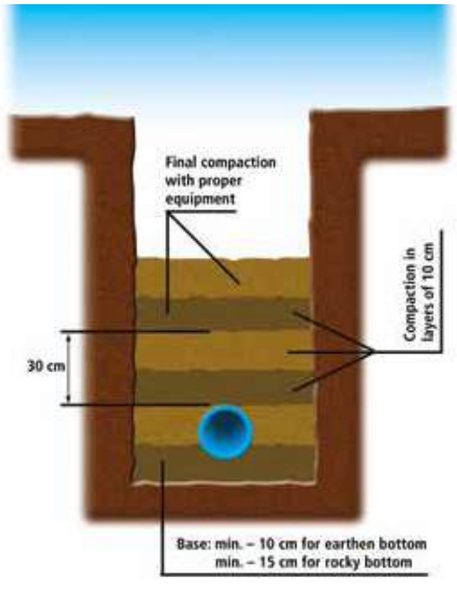
4.5.4. Pavement Backfill and Restoration

1) Before performing the backfill, all the joints must be checked for their watertightness. Inspections must be made, preferably between branch pipes and at most, every 500 meters.

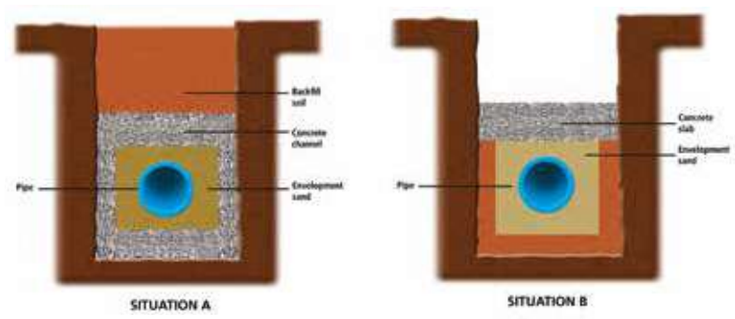
2) The piping with be covered with selected materials (free of rocks) at least 30 cm above the top generating line. Compaction must be in successive layers of 10 cm, and, until achieving the height of the pipe, compaction must be made manually only on the sides of the pipe.

3) The rest of the material should be poured in successive layers of 30 cm, and compacted so that they achieve the same ground condition as the sides of the ditch.

4) Observe the indications of the project and never use wheeled machines when compacting the ditch.



5) When the depth of the ditch is below 80 cm or when the pipeline goes through streets with heavy traffic load, railways, etc., special measures for protecting the pipeline are necessary, such as making channels with the pipes inside, enveloped in granular material and a proper reinforced concrete cover (situation A), or a proper reinforced concrete slab (situation B).



6) Direct enveloping of PVC pipes with concrete is not recommended as the concrete may break and reach the pipes. However, if the designer chooses this solution, he must dimension the concrete envelope, providing it with reinforcement to guarantee its performance as a continuous beam.

4.6. Recommendations

4.6.1. Watertightness tests

The test must be carried out every 500 of piping with water at a room temperature of 20°C.

The pressure must not exceed 1.5 times the maximum working pressure of the pipe, applied during over 1 hour, and, under no circumstances, over 24 hours.

Check the pipes and fittings for their anchoring. The pipe should be filled with water from the lowest point so that it expels the air from its inside. After waiting 24 hours with static pressure inside the pipe, pressurize the piping with a hand pump (slowly) until reaching the test pressure.

Table 5 - Consumption of Lubricant Paste

Gages	Lubricant Paste
DN	(g / joint)
100	25
150	40
200	50
250	60
300	70
400	90
500	110

4.6.2. Head Loss Tables

Below are the head loss tables for the Irriga LF DE- FoFo pipes, which are useful for dimensioning the lines when preparing the projects.

The calculation of head loss was based on the Colebrook Equation, the Universal Head Loss Equation, the Reynolds Number, and the Continuity Equation. Our results are deemed the most accurate according to the current concepts and technical resources of computer processing.

Colebrook Equation

$$\frac{1}{\sqrt{f}} = -2 \log_{10} \left(0{,}27 \frac{K}{D} + \frac{2{,}51}{R\sqrt{f}}\right)$$

Continuity Equation

$$Q = \frac{\pi D^2}{4} \qquad V = Cte.$$

Reynolds Equation

$$R = \frac{VD}{v}$$

Universal Head Loss Equation

$$hf = f. \frac{L}{D} \frac{V^2}{2g}$$

4.8. Handling

4.8.1. Maintenance

The damaged section must be replaced with a segment of the same type of pipe.

Maintenance operations in Irriga LF DEFoFo pipes must be easily carried out using Vinilfer Slip Couplings.

We recommend anchoring the slip coupling, so that only the piping can move.

4.8.2. Transport

Loading of trucks must be carried out so that the pipes do not sustain any damage or strain during the transport. They must be supported over their length, and avoid overlapping the spigot ends, bending the pipes, swinging them, or throwing them to the ground. Remember that pipes should not be dragged or bumped.

4.8.3. Storage

Provide a location to store the material near the construction site, and the pipes must not be exposed to weather for a prolonged time.

Stacking must be on sides, with either struts or stacks in the shape of a bonfire, without exceeding the maximum height of 1.5 m.

The first layer of the pipes must be fully supported, and the spigot ends of the pipes must be free.

We recommend protecting the spigot ends from sunlight as they have rubber seal rings that may damage.

For temporary protection, we recommend a wooden structure that is easy to disassemble, and covering it with tiles so that the pipes are 30 to 50 cm away from the roof so that the heat does not damage them.

Irriga EP e ES

PORTABLE SYSTEMS

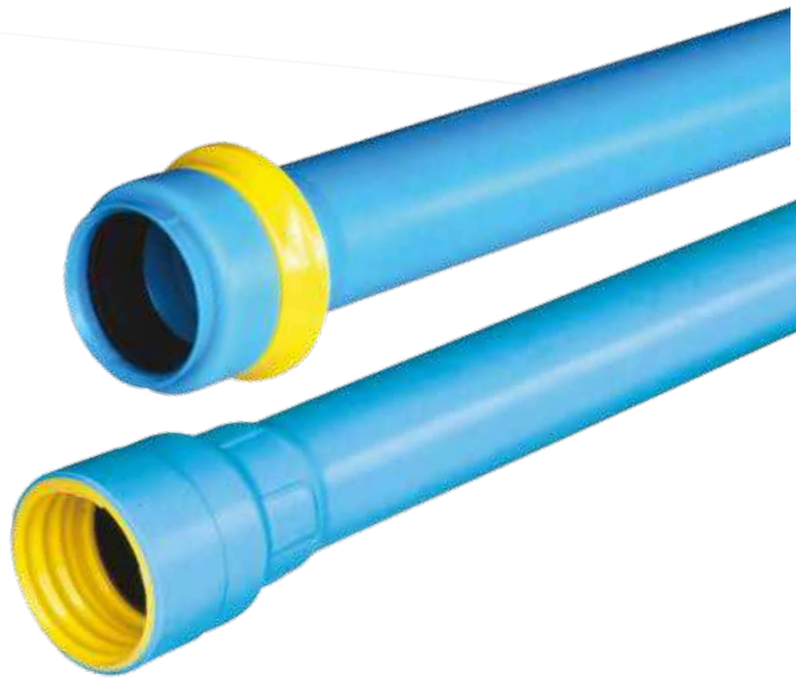
5. Irriga EP and ES Lines

With the modernization of agricultural techniques, irrigation plays an important role to contribute with increased productivity and profitability. We developed special quick coupling connectors for different sprinkler irrigation applications, especially farm produce.

The Plastic Thread Coupling and Metal Coupling, known by the acronyms EP and ES, respectively, are lines that are easy to assemble and disassemble and that remain with the same features after a prolonged time.

5.1. Function/Application

PVC pipes and fittings with plastic threaded coupling (EP) or metal coupling (ES), for irrigation systems that convey water at room temperature in mobile irrigation systems. Used in portable or semipermanent irrigation systems using conventional aspersion or cannon sprinklers. Can also be used in main lines in localized location system.



5.2. Benefits and Differential Factors

Complete line
Pipes and fittings that meet different installation needs.

Easy installation
Manually coupled without any tools due to the type of coupling.

Quick installation
Quicker assembly and disassembly, for use in several areas, reducing installation costs.

Resistance
Manufactured in PVC, pipes and fittings have high resistance to weather and chemicals used in fertirrigation.

Easy maintenance
There is no loss of pipes when performing corrective maintenance, thanks to the male and female bell ends and simple spigot end.

5.3. Technical Characteristics

Material: Components manufactured in PVC, Poly(vinyl chloride).

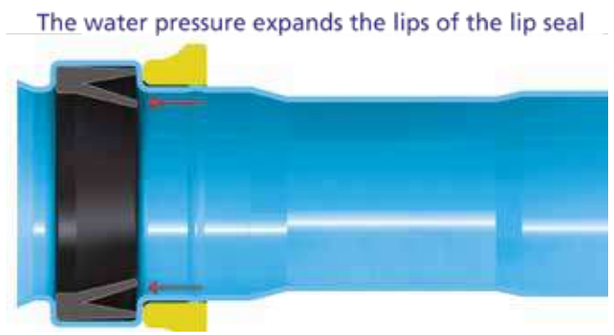
Color: Blue.

Service pressure: PN 80 (80 m.c.a).

Pipe Length: 6.0 m.

Sealing: Double lip seal.

Sealing obtained by the expansion of the ring when the system reaches the working pressure, offering good tightness.



Note: the ring already comes built in the pipes and fittings. When replacing, check for its proper positioning.

5.3.1. Characteristics of the Irriga EP Line

Coupling: PVC, threaded.

Color: yellow.

Type of coupling: Long pitch.

Pipes: With threaded bell and spigot.

Thread: Moving male thread (bell) and fixed female thread (spigot).

Available on diameters: 50(2") mm and 75(3") mm.

Pipe systems with an "EP" plastic coupling are one of the most sought-after products by farmers working with temporarily permanent systems, with pipes mounted in all branch pipes, throughout the entire crop cycle.

This irrigation system is most used in crops with very superficial root systems, where irrigation occurs by applying small layers of water with less frequency (reducing watering schedules), in which the movement of piping has been avoided to reduce labor and damage to the plants.

5.3.2. Characteristics of the Irriga ES Line

Coupling: Metal quick coupling (ES), PVC, yellow backing ring.

Type of coupling: Galvanized steel coupling.

Pipes: With threaded bell and spigot.

Available on diameters: 50(2") mm, 75(3") mm, and 100(4") mm.

The "ES" Metal Coupling is commonly used in crops of plants with a deeper root system, in which the piping must have their position changed more often.

In addition to easy assembly and disassembly, the line allows direct interchangeability with aluminum or steel pipes from other manufacturers who adopt the same basic coupling design and compatible dimensions.

In addition to excellent finish and increased resistance, the system has devices that limit the movement of the locking tilting rod. Thus, the tilting rod does not hit the pipe wall, avoiding damage to the piping.

Important:
Pipes and fittings of portable lines must not be buried due to the sealing system and their type of coupling.

Below is the list of reference standards concerning the manufacturing of the Irriga EP and ES lines that ensure excellent performance, providing the installations with high safety.

REFERENCE STANDARDS	
ABNT NBR 15282: 2005	PN 80 PVC pipes with quick joint to mobile irrigation systems

5.4. Instructions

5.4.1. Irriga EP

Systems must be assembled by threading the pipes and fittings by hand with the threads clean and free of soil particles.

The double lip seal used in the inside of the spigot of the female ends of the EP pipes, allows a small leakage when the pressure is below 0.5 Kgf/cm² (5 m.c.a.), therefore, likely to happen when starting and stopping the pumping system. The EP threads (BSP profile) do not promote tightness, and serve to attach the parts between each other.

The direction of the water flow from the male end to the female end is very important to provide a perfect sealing of the double lip seal.

Sprinkler riser pipes must be properly anchored to prevent them from falling down.

Pipes and fittings of the Irriga EP line must be always installed, and never buried, on the surface of the terrain.

5.4.2. EP Joint

1 Align the pipes and check the sealing ring for its proper position.

2 Attach the bell end of the pipe into the spigot end and tighten the end nut as usual.

3 Joint completed.

5.4.3. Irriga ES

Systems must be assembled by attaching pipes and fittings by hand with the bell end spigot ends clean and free of soil particles.

The direction of the water flow from the male end to the female end is very important to provide a perfect sealing of the double lip seal.

Sprinkler riser pipes must be properly anchored to prevent them from falling down.

Pipes and fittings of the Irriga ES line must be always installed, and never buried, on the surface of the terrain.

5.4.4. ES Joint

1 Align the pipes and check the sealing ring for its proper position.

2 Attach the bell end of the pipe into the spigot end and attach the metal coupling.

Note: pull the pipes, eliminating the clearance between the coupling and the yellow coupling ring.

3 Joint completed.

5.5. Recommendations

5.5.1 Sprinkler Valve and Quick Coupling

The valve and quick coupling for sprinklers facilitate the work of farmers, allowing them to quickly change a sprinkler from one point to another in an irrigation branch pipe.

In vegetable farming, using irrigation systems with several branch pipes installed at the same time is quite common, by chanting the sprinklers from one to another branch pipe.

In this case, using the valve and quick coupling for the sprinkler will be the best solution for changing the sprinklers, without any need cut off the water supply.

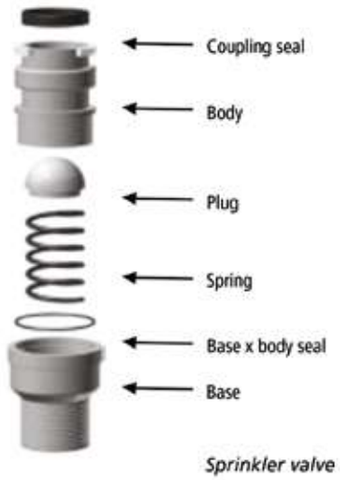
The valve and quick coupling for the sprinkler are sold separately, allowing the installation of valves in all branch pipes (in several sprinkler outlet points), making it possible to work with a reduced number of sprinklers.

Quick coupling for sprinkler

Valve for sprinkler

5.5.2. Installation and Operation

The sprinkler valve, with a 1" thread on its base, must be threaded over the sprinkler outlet.



Sprinkler valve

The quick coupling with a 1" female thread on the top must be threaded to the sprinkler riser pipe.

When coupling the assembly already mounted: sprinkler quick coupling + rise pipe + sprinkler over the valve, the water flows from the branch line to the sprinkler.

When decoupling the valve assembly to transfer it to another point, the valve closes automatically.

5.5.3. Head Loss Tables

Calculations based in the Colebrook Equation, in conjunction with the Continuity Equation, Reynolds Equation, and Universal Head Loss Equation, adopting a roughness K of 0.66 mm for the PVC.

Colebrook Equation:

$$\frac{1}{\sqrt{f}} = -2 \log_{10} \left(0{,}27 \frac{K}{D} + \frac{2{,}51}{R\sqrt{f}}\right)$$

Continuity Equation:

$$Q = \frac{\pi D^2}{4} \qquad V = Cte.$$

Reynolds Equation:

$$R = \frac{VD}{v}$$

Universal Head Loss Equation:

$$hf = f. \frac{L}{D} \frac{V^2}{2g}$$

5.7. Handling

5.7.1 Maintenance - Irriga EP

Preventive: we recommend cleaning the pipes and fittings with water jets when changing the installation.

Corrective: if repairing is required, remove the damaged part and weld an EP female bell end and/or male bell end, as applicable (see sequence below):

1. Chamfer the bell end of pipe. Sand the bell end and spigot end of pipe with a 100 grit sandpaper a nd mark the depth of the spigot end. Prepare the surfaces to be welded using the TIGRE Priming.

2. Apply the TIGRE plastic adhesive to the bell end of the pipe and the spigot end of the fitting.

3. Attach the bell end of the pipe to the spigot end of the fitting and remove any excess adhesive and then insert the bell end into the spigot end.

4. Repair completed.

5.7.2 Maintenance - Irriga ES

Preventive: we recommend cleaning the pipes and fittings with water jets when changing the installation.

Corrective: if repairing is required, remove the damaged part and weld ES female bell end and/or male bell end to redo de installation, as applicable (see sequence below):

1. Chamfer the bell end of pipe. Sand the bell end and spigot end of pipe with a 100 grit sandpaper and mark the depth of the spigot end. Prepare the surfaces to be welded using the TIGRE Priming.

2. Apply the TIGRE plastic adhesive to the bell en d of the pipe and the spigot end of the fitting.

3 Attach the bell end of the pipe to the spigot end of the fitting and remove any excess adhesive and then insert the bell end into the spigot end.

4 Repair completed.

5.7.3 Transport

Avoid strong impacts and friction with stones, metal objects, and sharp edges, to preserve the integrity of the pipes, especially the male/female ends.

The supporting surface must be flat, as the pipes must not sustain bending stresses for a long time.

In loading and unloading operations, avoid shock, bumps, and friction, especially in the male/female ends.

Always carry, and do not drag, the pipes, to preserve the integrity of the pipes.

5.7.4. Storage

For good preservation, the supporting structure must be leveled and the pipes must must have a brace every 1.5 meter.

We recommend storing the pipes in the shade.

Stacking should not exceed 1.5 m high (we recommend stacking the pipes in the shape of a bonfire or aligned lengthwise).

Irriga ES or EP pipes must be stored with their male and female ends alternated such that the spigots do not touch each other.

Notes

Agropecuária PVC

AGRICULTURE AND LIVESTOCK SYSTEMS

6. Agropecuária PVC Line

Agriculture and livestock are important industries for the economy and the environment. This industry is responsible for farming plants and animals for food. Tigre has solutions with excellent technology to convey water in an effective way for agriculture and livestock. Those systems are applied in rural properties to increase productivity and preserve the environment.

6.1. Function/Application

Tigre is expanding its Agropecuária PVC Line to meet different installation needs in agriculture. The line consists of blue pipes and fittings with diameters of 20, 25, 32, and 40 mm, and working pressure of 60 m.c.a.

6.2. Benefits and Differential Factors

Complete line
Meet the needs in the field.

Ease of installation
Uses adhesive weld joints, not requiring tools.

Lightweight
Lightweight pipes and fittings, facilitating handling, transport, and storage.

Resistance
Resists to chemicals used in fertirrigation and contaminated soils.

6.3. Technical Characteristics

Material: Components manufactured in PVC, Poly(vinyl chloride).

Color: Blue.

Working pressure (at 20ºC): 6.0 Kgf/cm² (60m.c.a.).

Pipes: Bell and spigot pipe.

Pipe length: 6.0 m.

Available on diameters: 20, 25, 32, and 40mm.

List of reference standards concerning the manufacturing of the Agropecuária PVC line that ensure excellent performance, providing the installations with high safety.

REFERENCE STANDARDS	
NBR 14654	Irrigation and drainage PVC pipes with solvent gluing PN 60 and PN 80
NBR 5648	Cold water supply in buil dings PVC pipes and fittings

***Note:** NBR 5648 standard used for dimensional reference. The product must not be applied in buildings.

6.4. Instructions

6.4.1. Assembly

Butt weld joints:

1. Sand the surfaces to be welded using TIGRE sandpiper.

2. Note that the attachment must be tight, which is almost impossible without the adhesive, because without pressure, the parts cannot

3. Clean the surfaces sanded of any dirt and grease with TIGRE Cleaning solution. Spread the adhesive evenly with a brush or the tip of the tube in the spigot and bell ends to be joined.

4. Attach the ends to the joined by making, while attaching, a slight rotating movement of 1/4 turn between the parts until they reach the position desired. Attach the parts and remove any excess adhesive, and wait for one hour to fill the pipe with water and 12 hours for carrying out the pressure test.

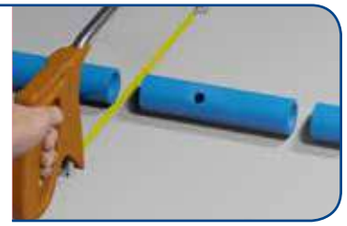
Installing the threaded fittings:

- Apply the thread seal tape in a sufficient quantity.
- Do not use too much, as it causes the fitting to break.
- Do not tighten too much, as it does not ensure sealing and breaks the fitting.
- Do not use PVC adhesive in the threads.
- Before threading the parts, check the male metal fitting for its size; if it is larger than the size of the spigot end, cut the excess; otherwise, do not thread the part beyond the stopper of the spigot end.

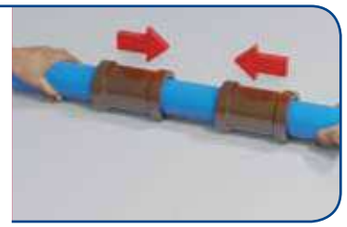
6.4.2. Maintenance

1. To solve problems that occur in points located in pipes in installations already completed, in consequence of small accidents (nail or drilled holes), or leakage in joints poorly made, TIGRE offers the Slip Coupling to its customers.

2 The TIGRE Slip Coupling is small and has a coupling system that allows interconnection between two fixed points. The wall must be open only in a small section, near the affected point.



3 Troubleshooting with Slip Couplings do not require adhesive and threads, since the slips have rubber seal rings. The damaged section must be replaced with a segment of the same type of pipe. Use two slip couplings, one at each end.



4 Moreover, the TIGRE Slip Coupling can also be used in exposed pipelines that have large straight sections, to correct or prevent any problem resulting from expansion and contraction. In that case, precautions are required to avoid displacement. The Slip Coupling must be secured so that only the pipe can move.

6.4.3 Storage

- Store at an easily accessible, shaded location, away from direct or continuous sunlight.
- We recommend stacking at a maximum height of 1.5 meter.
- Avoid strong impacts and friction with stones, metal objects, and sharp edges.
- In loading and unloading operations, avoid shock, bumps, and friction in the packaging, to avoid breakage.

Notes

Sprinklers

7. TIGRE Sprinklers

7.1. TIGRE Impact Sprinkler Line

TIGRE Impact Sprinklers have deliver water to the soil, in the form of artificial rain, to water the crops as required, ensuring more efficiency and more control in weather and soil conditions. A water jet, released under pressure, by a nozzle, sprays the water.

7.1.1. Function/Application

Application in different types of terrain and topography Moreover, TIGRE sprinklers can be used for irrigating different crops and in any type of soil. Does not require systematization of the irrigated terrain, but can be part of an automated irrigation system. Products available for several situations, such as the 360° sprinkler, which irrigates all the surrounding area, and the sectoral sprinkler, indicated for situations where regulated irrigation is necessary, such as on property borders, plantation edges, or road edges. Among other applications, they allow the use of fertilizers and pesticides diluted in water.

7.1.2. Benefits and Differential Factors

Wide flow range
Meet the needs in the field.

Efficiency
External jet breaker to regulate the rage and spraying of the water jet.

Savings
Durability, low cost, and proper water distribution.

UV Resistance
Thermoplastic additive against UV radiation.

7.1.3. Technical Characteristics

7.1.3.1. Characteristics - Tigre Pingo Mini Sprinkler

The Tigre Pingo mini sprinkler is ideal for irrigation systems requiring less flow and regulated irrigation.

Working pressure (at 20ºC): 6.0 Kgf/cm² (60m.c.a.).
Flow range: 0.32 to 1.86 m³/h.
Models available: 360° and sectoral.
Irrigation diameters: 19 to 24 meters.
Colored nozzles with engraved diameter in millimeters: easy identification.
Connection: threaded ½" male ISO 7.
360° sprinkler: with spraying angle of 25° and 20°.
Sectoral sprinkler: with spraying angle of 25°.

7.1.3.2. Characteristics - Tigre Midi Sprinkler

Sprinklers with intermediate flow and reach, for irrigation systems requiring regulated irrigation.

Flow range: 0.7 to 3.91 m³/h.
Models available: 360° and sectoral.
Irrigation diameters: 25 to 37 meters.
Colored nozzles with engraved diameter in millimeters: easy identification.
Connection: threaded 3/4" and 1" female ISO 7.
Spraying angles: 23° and 18°.

7.1.3.3. Characteristics - Tigre Eco Sprinkler

Sprinklers for any irrigation system requiring higher flow and reach of the jet water.

Flow range: 1.29 to 7.20m³/h.
Models available: 360°.
Irrigation diameters: 26 to 38 meters.
Connection: threaded 1" female ISO 7.
Spraying angles: 23°

7.1.4. Impact Sprinkler Line Items

7.2. TIGRE SempreVerde Fixed Sprinkler

SempreVerde sprinklers are indicated for permanent systems for irrigation of gardens, lawn, seedling nurseries, garden beds, and greenhouses. As they spray water uniformly with reduced drop diameters, they are indicated for all crops, from the most sensitive to the most resistant ones.

7.2.1. Function/Application

The SempreVerde permanent sprinklers irrigate the soil in the form of artificial rain, ensuring proper application, even in non-uniform areas.

7.2.2. Benefits and Differential Factors

Durability
Brass bonnet.

Efficiency
Allow uniform spraying, with reduced drop diameters; has a screw for slight adjustment of radius and flow.

UV Protection
Produced in engineering thermoplastic that ensure protection against sunlight.

7.2.3. Technical Characteristics

7.2.3.1. Technical Characteristics - SempreVerde 90°

Flow range: 0.13 to 0.36 m³/h.
Irrigation radius: 2.5 to 5.3 m.
Water jet height: 0.9 to 1.9 m.
Fitting: 1/2" female.

7.2.3.2. Características Técnicas SempreVerde 180°

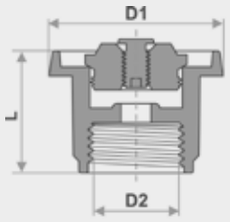
Flow range: 0.24 to 0.55 m³/h.
Irrigation radius: 2.3 to 5 m.
Water jet height: 0.9 to 1.7 m.
Fitting: 1/2" female.

7.2.3.3. Características Técnicas SempreVerde 360°

Flow range: 0.34 to 0.79 m³/h.
Irrigation radius: 1.5 to 5 m.
Water jet height: 0.8 to 1.5 m.
Fitting: 1/2" female.

7.2.4. SempreVerde Line Items

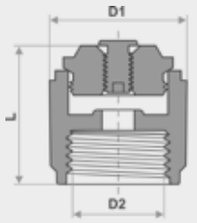
• SempreVerde Grass



DIMENSIONS (MM)

CÓDIGO	DESCRIPTION	D1	D2	L
100020182	SempreVerde Grama TIGRE 90	48	1/2"	28,3
100020184	SempreVerde Grama TIGRE 180	48	1/2"	28,3
100020186	SempreVerde Grama TIGRE 360	48	1/2"	28,3

• SempreVerde Pipe



DIMENSIONS (MM)

CÓDIGO	DESCRIPTION	D1	D2	L
100020183	SempreVerde Tubo TIGRE 90	25,6	1/2"	28,12
100020185	SempreVerde Tubo TIGRE 180	25,6	1/2"	28,12
100020187	SempreVerde Tubo TIGRE 360	25,6	1/2"	28,12

7.2.5. Performance Tables

SempreVerde | **TIGRE 90º**

Base pressure (mca)	Total flow m3/h	Radius (m)	Water jet height* (m)
5	0,13	2,5	0,9
10	0,20	3,7	1,1
15	0,25	4,2	1,3
20	0,29	4,7	1,5
25	0,33	5,1	1,7
30	0,36	5,2	1,9

SempreVerde | **TIGRE 180º**

Base pressure (mca)	Total flow m3/h	Radius (m)	Water jet height* (m)
5	0,24	2,3	0,9
10	0,33	3,2	1,0
15	0,40	3,8	1,1
20	0,45	4,3	1,3
25	0,50	4,7	1,5
30	0,55	5,0	1,7

SempreVerde | **TIGRE 360º**

Base pressure (mca)	Total flow m3/h	Radius (m)	Water jet height* (m)
5	0,34	1,5	0,8
10	0,47	2,7	0,9
15	0,57	3,6	1,1
20	0,65	4,2	1,3
25	0,72	4,7	1,4
30	0,79	5,0	1,5

*Water jet height above the nozzle level.
*Data obtained with the center screw completely opened.
